

1. Research Design

This study uses descriptive research design to observe and describe systematically about the characteristics of how phone screen time impacts the students' sleeping quality. Determining the relationships between phone screen time and the quality of sleep, these includes the sleep duration, and the bedtime routine. The study aims to describe these characteristics without manipulating any variables, providing an accurate and a clear concise of experience and behaviors.

2. Respondents

This study includes senior high school students enrolled in Alpha Life Academy during this school year 2025-2026. Respondents will be selected by using a random sampling method. The sample size is 50 students, depending on the availability and consent of the student. This study provides relevant insights into the relationship between phone screen time and sleep quality.

3. Research Instrument

This study will use a survey questionnaire as a tool to collect, measure, and analyze data. This questionnaire is designed to collect data information on students' on the impact of phone screen time and their sleep quality. It aims to describe and explore the relationships between mobile phones and the quality of their sleep.

4. Data Collection Procedure

The data for this study will be collected using a structured survey questionnaire distributed to selected school Alpha Life Academy. Prior to distributing and seeking permission from the school authorities and ensuring that all participants are informed about the purpose of the study. The questionnaire will be administered either printed form or online form, depending on its accessibility and school guidelines. The respondents will be given enough time to complete the survey questionnaire. Once the questionnaires are collected, the responses will be checked for completeness, organized and it will be encoded to be analyzed.
